Creative Software Design

7 – Standard Template Library

Yoonsang Lee Fall 2020

Midterm Exam

- No midterm exam for this course.
- I hope we can have an offline final exam.
- For students taking exams next week, we'll have no lecture & labs next week.

Today's Topics

- Intro to Template (briefly)
- STL (Standard Template Library)
- Containters
 - std::vector, std::list
 - std::stack, std::queue
 - std::set, std::map
- Iterator
- std::string

Template

- Functions and classes can be "templated".
- This allows a function or class to work on many different data types

without being rewritten for each one.

```
#include <iostream>
using namespace std;
class CintPoint{
private:
    int x, y;
public:
    CintPoint(int a, int b) { x = a; y = b; }
    void move(int a, int b) { x +=a; y +=b; }
    void print(){ cout << x << " " << y << endl;}</pre>
};
class CdoublePoint{
private:
    double x, y;
public:
    CdoublePoint(double a, double b) { x = a; y = b; }
    void move(double a, double b){ x +=a; y += b;}
    void print(){ cout << x << " " << y << endl;}</pre>
};
int main(){
    CintPoint P1(1,2);
    CdoublePoint P2(1.1, 2.1);
    P1.print();
    P2.print();
```

#ind	clude <iostream></iostream>
usir	ng namespace std;
temp	olate ≺typename T>
clas	ss Point{
priv	vate:
	Тх, у;
pub1	lic:
-	Point(T a, T b){ $x = a; y = b;$ }
	<pre>void move(T a, T b){ x +=a; y += b;}</pre>
	<pre>void print(){ cout << x << " " << y << endl;]</pre>
};	
int	main(){
	<pre>Point<int> P1(1,2);</int></pre>
	Point <double> P2(1.1, 2.1);</double>
	P1.print();
	P2.print();
}	

An example of class template

Standard Template Library (STL)

- STL defines powerful, template-based, reusable components.
- A collection of useful template for handling various kinds of data structure and algorithms
 - Containers: data structures that store objects of any type
 - Iterators: used to manipulate container elements
 - Algorithms: operations on containers for searching, sorting and many others

Containers

- Sequential container, Container adaptor, Associative container
- Sequential container
 - Elements are accessed by their "position" in the sequence.
 - vector: fast insertion at end, random access
 - list: fast insertion anywhere, sequential access
 - deque (double-ended queue): fast insertion at either end, random access
- Container adapter
 - "Adapting" the interface of underlying container to provide the desired behavior.
 - stack: Last In First Out
 - queue: First In First Out

Containers

- Associative container
 - Elements are referenced by their **key** and not by their absolute position in the container, and always sorted by keys.
 - map: a mapping from one type (key) to another type (value)
 - set: add or delete elements, query for membership...
- There are a few more containers in STL, but this course covers only the most popular ones.

```
#include <iostream>
#include <vector>
using namespace std;
int main(void){
    vector<int> intVec(10);
    for(int i=0; i< 10; i++){</pre>
             cout << "input!";</pre>
             cin >> intVec[i];
     ł
     for(int i=0; i< 10; i++){</pre>
             cout << intVec[i] << " ";</pre>
     }
    cout << endl;</pre>
    return 0;
```

```
#include <iostream>
#include <vector>
using namespace std;
int main(void){
    vector<int> intVec;
    int temp;
    for(int i=0; i< 3; i++){</pre>
        cout << "input!";</pre>
        cin >> temp;
        intVec.push_back(temp);
    for(int i=0; i< (int)intVec.size(); i++){</pre>
        cout << intVec[i] << " " ;</pre>
    3
    cout << endl;
    cout << "size" << intVec.size() << endl;</pre>
    intVec.resize(intVec.size()+3);
    cout << "size" << intVec.size() << endl;</pre>
    for(int i=(int)intVec.size()-3; i< (int)intVec.size(); i++){</pre>
        intVec[i] = i;
    3
    for(int i=0; i< (int)intVec.size(); i++){</pre>
        cout << intVec[i] << " ";</pre>
    }
    cout << endl;
    return 0;
```

```
#include <iostream>
#include <vector>
using namespace std;
int main(void){
   vector<int> intVec;
   intVec.push_back(10);
   intVec.push_back(20);
   if (intVec.empty() == true){
        cout << "size of Vector is " << intVec.size();</pre>
   }
   cout << intVec.front() << endl;</pre>
   cout << intVec.back() << endl;</pre>
   intVec.pop_back();
   cout << intVec.back() << endl;</pre>
   intVec.clear();
```

• You can make a vector of strings or other classes.

```
#include <string>
#include <vector>
using namespace std;
struct Complex { double real, imag; /* ... */ };
// ...
vector<string> vs;
for (int i = 0; i < 10; ++i) cin >> vs[i];
// vector(size, initial value)
vector<string> vs2(5, "hello world");
vector<Complex> v1(10);
vector<Complex> v2(10, Complex(1.0, 0.0));
Complex c(0.0, 0.0);
v2.push back(c);
for (int i = 0; i < v2.size(); ++i) {</pre>
  cout << v2[i].real << "+" << v2[i].imag << "i" << endl;
}
```

• Sometimes you may want to use a vector of pointers.

```
#include <vector>
using namespace std;
class Student;
vector<Student*> vp(10, NULL);
for (int i = 0; i < vp.size(); ++i) {
   vp[i] = new Student;
}
// After using vp, all elements need to be deleted.
for (int i = 0; i < vp.size(); ++i) delete vp[i];
vp.clear();</pre>
```

std::vector

- Element are stored in contiguous storage, like an array.
- Random access (by index): Fast access to any element
- Fast addition/removal of elements at the **end** of the sequence.
- Much more flexible and powerful than array. **From now on, use std::vector instead of array.**
 - <u>https://www.stroustrup.com/bs_faq2.html#arrays</u>

References for STL

- std::vector
 - <u>http://www.cplusplus.com/reference/vector/vector/</u>

- STL containers
 - <u>http://www.cplusplus.com/reference/stl/</u>

• You can find documents for any other STL features in the links in the above pages.

Iterator

- Iterator: a pointer-like object **pointing to** some element in a container.
- Iterators provide **a generalized way** to traverse and access elements stored in a container.
 - can be ++ or -- (move to next or prev element)
 - dereferenced with *
 - compared against another iterator with == or !=
- Iterators are generated by STL container member functions, such as begin() and end().

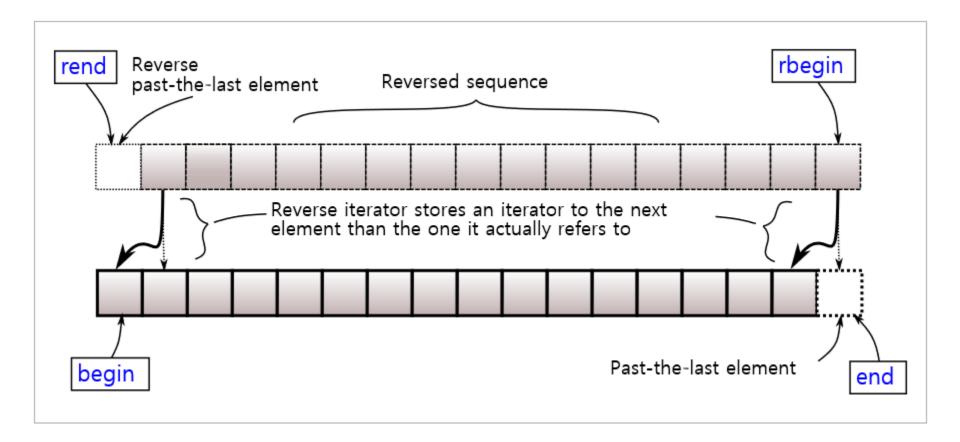

std::vector with iterator

```
#include <iostream>
#include <vector>
using namespace std;
void printVec(vector<int> intV, string name){
    vector<int>::iterator iter;
    cout << name << " ";</pre>
    for (iter=intV.begin(); iter != intV.end(); iter++)
        cout << *iter << " ";
    cout << endl;</pre>
int main(void){
    vector<int> intVec(5);
    vector<int>::iterator iter = intVec.begin();
    for(int i=0; i < 5; i++){</pre>
        *iter = i;
        iter++;
    ł
    printVec(intVec, "intVec");
    intVec.insert(intVec.begin()+2, 100);
    printVec(intVec, "intVec");
    intVec.erase(intVec.begin()+2);
    printVec(intVec, "intVec");
```

std::vector with iterator

```
#include <vector>
#include <iostream>
using namespace std;
int main(void) {
// vector(sz)
vector<int> v(10);
for (int i = 0; i < v.size(); ++i) v[i] = i;</pre>
// begin(), end()
for (vector<int>::iterator it = v.begin(); it != v.end(); ++it) {
  cout << " " << *it;
// Output: 0 1 2 3 4 5 6 7 8 9
// rbegin(), rend()
for (vector<int>::reverse iterator it = v.rbegin(); it != v.rend(); ++it) {
 cout << " " << *it;
// Output: 9876543210
```

Meaning of begin(), end(), rbegin(), rend()

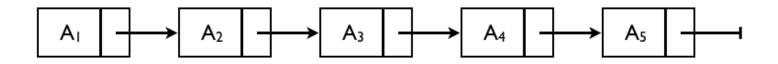

Quiz #1

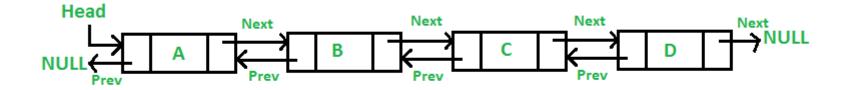

- Go to <u>https://www.slido.com/</u>
- Join #csd-hyu
- Click "Polls"
- Submit your answer in the following format:
 - Student ID: Your answer
 - e.g. 2017123456: 4)
- Note that you must submit all quiz answers in the above format to be checked as "attendance".

Concept of Linked List

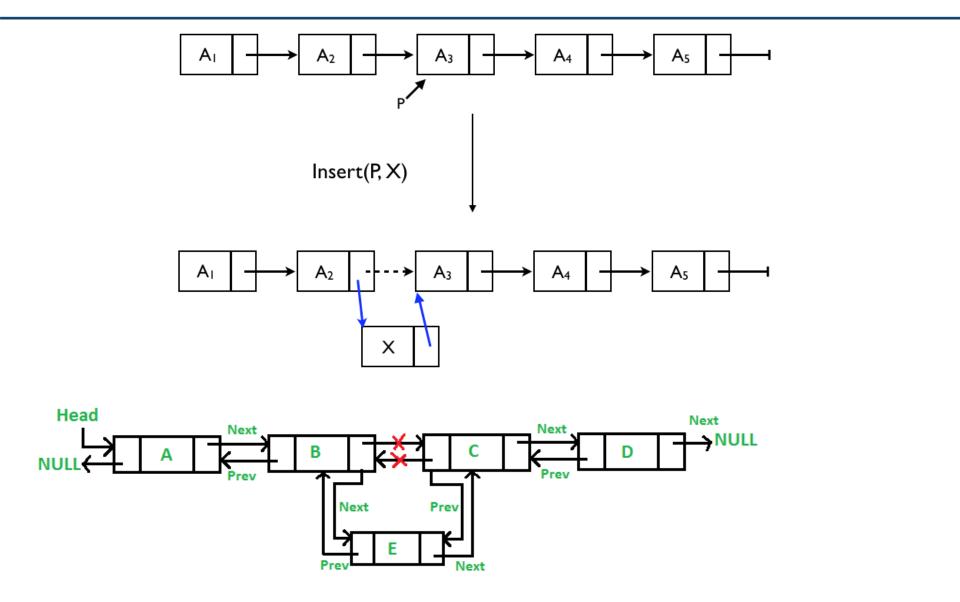

• Singly linked list: A node consists of the data and a link to the next node.

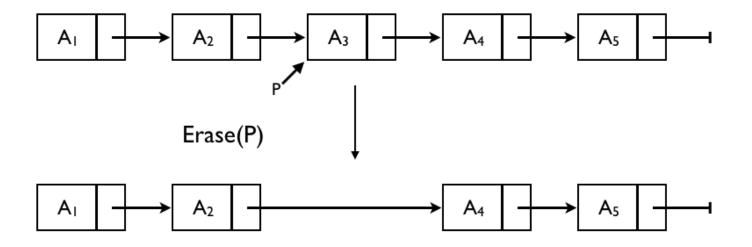

• Doubly linked list: with links to prev. & next node.

Concept of Linked List: insert

Concept of Linked List: erase

std::list

- Implemented as a doubly-linked list.
 - Non-contiguous storage.

- Sequential access
 - One should iterate from a known position (like begin() or end()) to access to some element.

• Fast addition/removal of elements **anywhere** of the sequence.

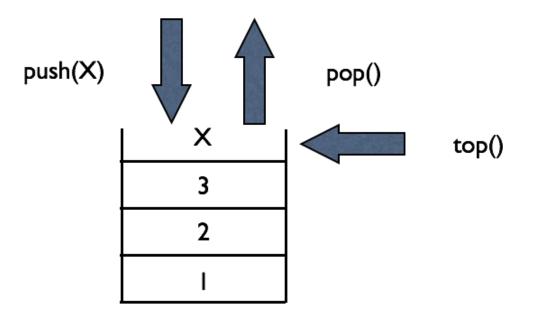

std::list - an insert and erase example

```
void printList(list<int> intV){
    list<int>::iterator iter;
    for (iter = intV.begin(); iter != intV.end(); iter++){
        cout << *iter << " ";</pre>
    }
    cout << endl;
}
int main(){
    list<int> intL(5);
    list<int>::iterator iter = intL.begin() ;
    for (int i=0; i < 5; i++){</pre>
        *iter = i;
        iter++;
                                                 An iterator that points to the first of the newly inserted
    3
                                                 elements.
    printList(intL);
    iter = intL.begin();
    iter++;
    iter = intL.insert(iter, 100);
    printList(intL);
    iter++; iter++;
    cout << *iter << endl;</pre>
    intL.erase(iter);
                                                                   1234
    printList(intL);
                                                                   100 1 2 3 4
                                                                0
                                                                2
    return 0;
                                                                   100 1 3 4
                                                                0
```

std::list – a remove example

```
#include <list>
#include <iostream>
#include <algorithm>
using namespace std;
int main(){
   list<int> lt;
   lt.push_back(10);
   lt.push_back(20);
   lt.push_back(30);
   lt.push_back(40);
   list<int>::iterator iter;
    for(iter=lt.begin(); iter != lt.end(); iter++)
        cout << *iter << ' ':
    cout << endl;</pre>
                                               An iterator pointing to the new location of the element that
                                               followed the last element erased by the function call.
   iter = lt.begin();
    iter++;
    iter++;
    cout << *iter << endl;</pre>
   list<int>::iterator iter2 = lt.erase(iter);
    cout << *iter2 << endl;</pre>
   lt.remove(10);
    for(iter=lt.begin(); iter != lt.end(); iter++)
                                                                10 20 30 40
        cout << *iter << ' ';
                                                                30
    cout << endl:
                                                                40
    return 0;
                                                                20 40
```

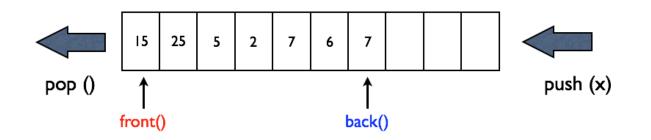

Concept of Stack : Last In First Out

std::stack - example

```
#include <iostream>
#include <vector>
#include <stack>
using namespace std;
int main(){
    stack<int> st;
    st.push(10);
    st.push(20);
    cout << st.top() << endl;</pre>
    st.pop();
    cout << st.top() << endl;</pre>
    st.pop();
    if (st.empty())
        cout << "no data in the stack음" << endl;</pre>
    return 0;
}
```

Concept of Queue : First In First Out

std::queue - example

```
#include<iostream>
#include<queue>
using namespace std;
int main(void){
    queue<int> q;
    cout << "size : " << q.size() << endl;</pre>
    q.push(10);
    q.push(20);
    q.push(30);
    cout << "size : " << q.size() << endl;</pre>
    cout << "front : " << q.front() << endl;</pre>
    cout << "back : " << q.back() << endl << endl;</pre>
    while(!q.empty()){
        cout << q.front() << endl;</pre>
        q.pop();
    ł
    return 0;
```

```
size : 0
size : 3
front : 10
back : 30
10
20
30
```

Other Vector-like Containers

• List, stack, queue, and deque (double-ended queue).

	vector	list	stack	queue	deque
Random access	operator[] at()	-	-	-	operator[] at()
Sequential access	front() back()	front() back()	top()	front() back()	<pre>front() back()</pre>
Iterators	<pre>begin(), end() rbegin(), rend()</pre>	<pre>begin(), end() rbegin(), rend()</pre>	-	_	<pre>begin(), end() rbegin(), rend()</pre>
Adding elements	<pre>push_back() insert()</pre>	<pre>push_front() push_back() insert()</pre>	push()	push()	<pre>push_front() push_back() insert()</pre>
Deleting elements	pop_back() erase() clear()	<pre>pop_front() pop_back() erase() clear()</pre>	pop ()	pop ()	<pre>pop_front() pop_back() erase() clear()</pre>
Adjusting size	resize() reserve()	resize()	-	_	resize()

std::map

• Contains key-value pairs with **unique keys**.

• Associative: Elements are referenced by their key, and always sorted by keys.

• Accessing with keys is efficient.

std::map - example

```
#include <map>
#include <iostream>
using namespace std;
int main(void){
  map <string, double> m;
  for (int i=0; i<4; i++) m.insert(make_pair("string"+to_string(i), 0.5*i));</pre>
  for (map<string, double>::iterator it = m.begin(); it !=m.end(); ++it){
      cout << " " << it->first << "," << it->second << endl ;</pre>
  3
  m.insert(make_pair("apple", 10));
  m["orange"] = 3.14;
  m["string0"] = 111;
  for (map<string, double>::iterator it = m.begin(); it !=m.end(); ++it){
      cout << " " << it->first << "," << it->second << endl ;</pre>
  }
  map<string, double>::iterator it;
  it = m.find("apple");
  cout << "output " << it->first << " " << (*it).second << endl;</pre>
  m.clear();
  return 0;
```

std::set

• Contains unique keys.

• Associative: Elements are referenced by their key, and always sorted by keys.

• Accessing with keys is efficient.

std::set - example

```
#include <set>
using namespace std;
set<int> s;
for (int i = 0; i < 10; ++i) s.insert(i * 10);</pre>
for (set<int>::const iterator it = s.begin(); it != s.end(); ++it) {
  cout << " " << *it; // s: 0 10 20 30 40 50 60 70 80 90
}
cout << s.size();</pre>
cout << s.empty();</pre>
set<int>::iterator it, it low, it up;
it = s.find(123); // it == s.end()
                                   // s: 0 10 20 30 40 50 60 70 80 90
it = s.find(50);
                                   11
                                                        ^it
s.clear();
                                  // s:
```

Quiz #2

- Go to <u>https://www.slido.com/</u>
- Join #csd-hyu
- Click "Polls"
- Submit your answer in the following format:
 - Student ID: Your answer
 - e.g. 2017123456: 4)
- Note that you must submit all quiz answers in the above format to be checked as "attendance".

Iterator again

• Iterators provide **a generalized way** to traverse and access elements stored in a container.

• Iterators serve as **an interface** for various kinds of containers.

• Passing and returning iterators makes an algorithms more generic, because the algorithms will work for **any** containers.

Algorithm

- Many useful algorithms are available
 - sort
 - min, max, min_element, max_element
 - binary_search

std::sort

void sort(RandomAccessIterator first, RandomAccessIterator last); Void sort(RandomAccessIterator first, RandomAccessIterator last, Compare comp)

```
#include <iostream>
#include <vector>
#include <algorithm>
using namespace std;
int main(void){
    vector<int> v;
    int input;
    cin >> input;
    while (input != 0) {
        v.push_back (input);
        cin >> input;
    sort(v.begin(), v.end());
    for (int i = 0; i < (int)v.size(); i++)</pre>
        cout << v[i] << "\n";
    return 0;
```

std::min, std::max, std::min_element, std::max_element

```
#include <vector>
#include <iostream>
#include <algorithm>
#include <cstdlib> //for rand() and srand()
#include <ctime> //for time()
using namespace std;
int main(){
const int a = 10, b = 15;
int minv = min(a,b);
int max = max(a,b);
cout << minv << " " << maxv << endl;
vector<int> v(10);
for (int i = 0; i < (int)v.size(); ++i)</pre>
    v[i] = 2*i;
vector<int>::iterator it;
it = min_element(v.begin(), v.end());
random_shuffle(v.begin(), v.end());
for (int i = 0; i < (int)v.size(); ++i)</pre>
    cout << " " << v[i];
cout << endl;
sort(v.begin(), v.end());
for (int i = 0; i < (int)v.size(); ++i)</pre>
    cout << " " << v[i];
cout << endl;</pre>
return 0:
```

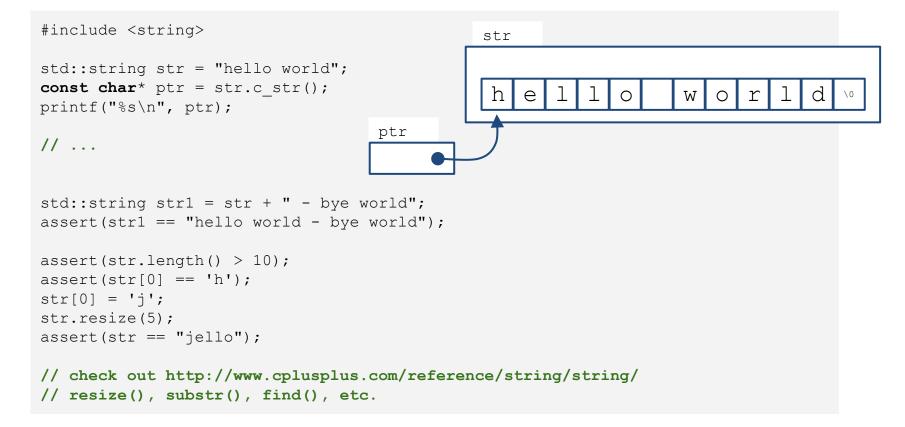

std::string - constructor

• In C++, STL provides a powerful string class.

```
#include <iostream>
using namespace std;
int main(void){
   string one("Lottery Winner!"); //string (const char *s)
   cout << one << endl;
   string two(20, '$');
                                       //string (size_type n, char c)
   cout << two << endl;</pre>
   string three(one);
                                      //string (const string & str)
   cout << three << endl;
                                                                         Lottery Winner!
   one += "0oops!";
   cout << one << endl;
                                                                         $$$$$$$$$$$$$$$$
                                                                         Lottery Winner!
    return 0:
                                                                         Lottery Winner! Oops!
```

(Recall) std::string - c_str()

• Returns a pointer to a null-terminated string array representing the current value of the string object.

(Recall) std::string - input

(Recall) std::string - input

• Note that std::string automatically resize to the length of target string.

char fname[10]; string lname; cin >> fname; // could be a problem if input size > 9 characters cin >> lname; // can read a very, very long word cin.getline(fname, 10); // may truncate input getline(cin, lname); // no truncation

std::string - input from file

```
#include <iostream>
#include <fstream>
#include <string>
#include <cstdlib>
int main()
{
    using namespace std;
    ifstream fin;
    fin.open("tobuy.txt");
    if (fin.is open() == false)
     {
       cerr << "Can't open file. Bye.\n";</pre>
       exit(EXIT FAILURE);
     }
     string item;
    int count = 0;
    getline(fin, item, ':');
    while (fin) // while input is good
     ł
        ++count;
       cout << count <<": " << item << endl;</pre>
       getline(fin, item, ':');
     }
    cout << "Done\n";</pre>
    fin.close();
    return 0;
```

std::string - find

```
size_t find(const string& str, size_t pos = 0) const;
size_t find(char c, size_t pos = 0) const;
[from http://www.cplusplus.com/]
```

```
#include <iostream>
#include <iostream>
#include <string>
using namespace std;
int main() {
   string str("There are two needles in this haystack with needles.");
   string str2("needle");
   size_t found;

   if ((found = str.find(str2)) != string::npos) {
      cout << "first 'needle' found at: " << int(found) << endl;
    }
    str.replace(str.find(str2), str2.length(), "preposition");
    cout << str << endl;
    return 0;
}</pre>
```

first 'needle' found at: 14 There are two prepositions in this haystack with needles.

std::string - substr

generalities live in details.

Quiz #3

- Go to <u>https://www.slido.com/</u>
- Join #csd-hyu
- Click "Polls"
- Submit your answer in the following format:
 - Student ID: Your answer
 - e.g. 2017123456: 4)
- Note that you must submit all quiz answers in the above format to be checked as "attendance".

Next Time

- Labs in this week:
 - Lab1: Assignment 7-1
 - Lab2: Assignment 7-2

• No lecture & labs next week!

- Next lecture (the week after next):
 - 8 Inheritance, Const & Class
